COMPUTER SKILLS

Web developer with experience in PHP, HTML5, Git, CSS/CSS3, SCSS, Gulp, Compass, JavaScript, JQuery, Vue(a little), Laravel (more than Vue, less than MODX, unfortunately), Blade, PhpStorm, composer, npm, bootstrap3, bootstrap4. Experience in Content Management System such as MODX, Wordpress, Bitrix(include bitrix only for list). Strong on MODX, i create about 25 sites and several modules on this CMS.

OBJECTIVE

Now I work at a company whose main specificity is the creation and support of sites on MODX & Bitrix. Now I'm writing a simple B2B application on Laravel, but this is more likely an exception (its code I don't include in examples, because this is the future control panel of the site). Why I decided to change jobs, I argued a little lower - in the block about Laravel. What I'm looking for is a place where (mostly) work with modern technologies, with Laravel or Symfony, where I could be learn good practices and solve various tasks in the framework of modern approaches.

Laravel

<http://snarksliveshere.xyz> Initially I wrote for myself a simple blog, but after I decided to expand it to an easy online store with shopping offers. Since the application was written for practice, I didn't use it in Aimeos or Voyager.

In the process I was just fascinated by this framework, especially after a huge amount of strange bitrix code that I had to work with.

And after I began to create Laravel application, I decided to change my place of work, since dealing with bad practices Bitrix after Laravel became much harder and meaningless.

Source code at github.com/snarksliveshere/larablog.logquest access to the admin area login: test pass: test

Symfony

Now I'm studying version 4, the application is in the development process, while it can only output, add, update and delete the record.
github.com/snarksliveshere/symfony_microblog Simple CRUD is a simple CRUD.

Since next to Laravel is Vue, then I wrote a test project on it. The project was written according to the lessons, I do not have enough practice in Vue
[yet.github.com/snarksliveshere/vue.spa](https://github.com/snarksliveshere/vue.spa)

Deploy

I raised docker I picked up of the second configuration version, here in this version github.com/snarksliveshere/.../docker-compose.yml

But now I often use vagrant (laravel homestead), but more for practice in it, the docker seemed to me much better.

LAMP / LEMP

site snarksliveshere.xyz works on apache2, I raised VDS on Ubuntu 16.04, at home for practice on my Ubuntu raise the site on nginx. I really want to understand cluster systems, where nginx acts as a balancer, but so far there is no time for it.

(more, for the sake of practice, I wrote a script to clean up unused css classes that parse links from the main page, take all classes and, comparing them with classes in css files, clean up the unused ones and form the final css file github.com/snarksliveshere/csscleaner)

Where I am working now, I also have a lot of time to markup and JS (JQuery in general), edits on existing sites, but there are also clean projects, such

as github.com/snarksliveshere/strela (it's still not fully integrated) and the demo-sites of the company stroy.ardmedia.ru/ and demo6.ardmedia.ru - demo8.ardmedia.ru & demo12.ardmedia.ru - demo16.ardmedia.ru. Below I wrote all the links to them.

Since I often have to edit sites rather than create, I have more practice in JQuery, with Vanilla JS I work less often, there is no special stuffing, but I did not cause any special difficulties what I did. But much more I like the back-end architecture on php, so I'm developing this way.

I use SCSS & GULP & bootstrap 3 || 4 for markup.

from CMS I worked most closely with MODX & Bitrix, edits were also on many others (WordPress, opencart etc), when I worked in freelancing, actively used Joomla, but I don't see prospects for them in myself, therefore, probably not I will paint specifically. Bitrix I give only for the list, I have no desire to improve in it. On MODX, I created about 25 sites (mostly e-commerce), Bitrix - more creation of new functionality and edits e-commerce websites.

What in the end:

First, when I studied Laravel, I just wanted to get acquainted with new technologies and principles, MODX and xPDO seemed to me quite flexible and I even began to write notes for the component of trade offers for minishop2.

But, in the process of building the application, Laravel began to have a serious impact on my value system and understanding of the flexibility and capabilities of truly modern technologies.

At the same time, there was growing awareness that working with CMS, even with MODX, is rather just a struggle against restrictions if you want to do something non-standard. And, on the contrary, Laravel, which made it possible to do complex things simply and beautifully (while I was still dealing with ExtJS for my component), caused in me a lot of positive emotions and enthusiasm.

WORK EXPERIENCE

Ard media

Feb 2017 — Present

PHP Developer

- Develop and maintain e-commerce and other responsive websites using xPDO, MODX, PHP, MySQL, JQuery/JavaScript.
- Created new websites for individuals and business using HTML/HTML5, CSS3, SCSS, Gulp and Photoshop.
- Updated and maintained exististing responsive websites to raise CTR.

freelance

Jan 2010 — Oct 2016

HTML/CSS Developer

- Created and maintained standart based websites using HTML/CSS, jquery, php, mysql, Joomla, Wordpress

Intercom

dec 2008 — feb 2009

Technical support

Technical support in ISP company

QUALIFICATIONS Develop and maintain sites:

- <http://www.germes-gp.ru/> (+ developing compare module)
- <http://alvita-a.ru>
- <http://6x9elit.ru>
- <http://allbesttoys.ru>

EDUCATION

MS in Psychology

September 2000 — Aug 2005

GAUGN

<https://gaugn.ru/en-us/>

State Academic University for the Humanities

INTERESTS

Right now my interests are php & modern frameworks. At this moment, I'm starting to learn Symfony

LANGUAGES

Russian fluent,
English mostly for reading technical documentation, I'm a bit out of speaking practice
